

## Class 10: review

Programming for VR I

Patrick Mineault

## Next class: exam

- ▶ Open-book, open-search, on the computer (includes these slides)
- ▶ Individual
- ▶ 3 hours
- ▶ Real-world problem
- ▶ Covers everything we've seen so far

# What we have seen so far

- ▶ Python syntax
- ▶ If/else
- ▶ Git
- ▶ Variables and basic data types
- ▶ Arithmetic
- ▶ For loops
- ▶ Random variables
- ▶ Functions
- ▶ Processing.py basics and flow, globals
- ▶ Coordinate systems
- ▶ Responding to inputs
- ▶ Debugging

## Python syntax and if/else

```
if 2 + 2 == 4:
    print("Everything is right with the world.")
else:
    print("Mayhem!")
print("The end.")
```

# Python syntax and if/else

- ▶ print function
- ▶ indentation is critical
- ▶ if/else block

# Git and Github

- ▶ Three commands:
- ▶ `git add`
- ▶ `git commit -m "message"`
- ▶ `git push`
- ▶ Commit often, push often (e.g. once a class)
- ▶ When in doubt, search for “git cheat sheet”

## Variables and basic data types

```
num = 2 + 2
if num == 4:
    print("Everything is right with the world.")
else:
    print("Mayhem!")
print("The end.")
```

# Variables and basic data types

- ▶ variables: declare your own
- ▶ ints: 4, -27
- ▶ floats: 3.14159, 10.01
- ▶ strings: "hello", "world"
- ▶ booleans: True, False

# Arithmetic

► `+, -, *, /, %, **, ()`

## For loops

```
for i in range(5):  
    print(i)
```

...

0

1

2

3

4

# Random variables

```
import random  
print(random.random())
```

# Functions

```
def minus_fun(arg0, arg1):  
    return arg0 - arg1
```

- ▶ def, function name, arguments and returns

# Processing.py basics

- ▶ `setup` called once
- ▶ `draw` called once per frame by default (60 fps)
- ▶ draw into the window
- ▶ <https://py.processing.org/reference/>

## Processing.py skeleton

```
def setup():  
    size(400, 400)  
  
def draw():  
    line(0, 0, mouseX, mouseY)
```

## Processing.py skeleton

```
def setup():  
    size(400, 400)  
  
def draw():  
    line(0, 0, mouseX, mouseY)
```

## Basic functions

- ▶ `line(x1, y1, x2, y2)`: draws a line
- ▶ `rect(x, y, wight, height)`: draws a rectangle
- ▶ `ellipse(x, y, width, height)`: draws an ellipse
- ▶ `point(x, y)`: draws a point
- ▶ `fill(r, g, b)`: sets the fill color
- ▶ `stroke(r, g, b)`: sets the stroke color
- ▶ `background(r, g, b)`: sets the canvas to the background color

# Coordinate systems

Figure 1: Coordinate system

## Stacked coordinate systems

```
pushMatrix()  
translate(x, y)  
house()  
popMatrix()
```

# Transformations

- ▶ `translate(x, y)`
- ▶ `rotate(radians)`: note  $180 \text{ degrees} = \text{PI radians}$
- ▶ `size(scalex, scaley)`

## Responding to inputs

- ▶ `mouseX`, `mouseY`: mouse position
- ▶ `mousePressed`: whether any mouse button is pressed
- ▶ `mouseButton`: which mouse button is pressed, either `LEFT` or `RIGHT` (no quotes! these are `CONSTANTS`)
- ▶ `keyPressed`: whether a key has been pressed
- ▶ `key`: the key that's been pressed (e.g. `'A'`, `'/'`, or `CODED`)
- ▶ `keyCode`: the key code when a special key has been pressed, for example, `UP`, `DOWN`, `LEFT`, `RIGHT`, `CTRL`, `SHIFT`.

# Debugging

- ▶ Google the error
- ▶ Read the manual
- ▶ Double-check the code
- ▶ Pair program
- ▶ Ask somebody else to look at your code
- ▶ Add print statements
- ▶ Refactor your code
- ▶ Use a debugger

# Challenge I

- ▶ Single screen version of Flappy bird

[https://www.youtube.com/watch?time\\_continue=86&v=HizwCzUOt](https://www.youtube.com/watch?time_continue=86&v=HizwCzUOt)

## Challenge II

- ▶ 10-minute game
- ▶ <https://www.youtube.com/watch?v=p8MzsDBI5EI>
